

Simulating The Global Economic Transition with the Global Gaidar Model

Seth Benzell, Guillermo Lagarda, Maria Kazakova, Laurence Kotlikoff,
Kristian Nesterova, Marco Solera, Victor Ye, Andrey Zubarev

September, 2018

The Global Gaidar Model

- 17-Region, 90-Period Global OLG Simulation Model
- Single Good (so far).
- Perfect Foresight
- Built to Study Demographic, Fiscal, and Technological Transition
- Big Questions: Which Regions Will Dominate the World Economy in 2100? Will We See Convergence in Per Capital GDP Across Regions? Will Labor-Saving Technological Change and Robotization Help Or Hurt Our Kids?

The GGM Blocks

- Walliser Demographics
- Households
- Production sector
- Government sector
- Oil endowment
- Catch Up and Secular Productivity Growth
- Robotization (Coming)

The Composition of Regions in The Global Gaidar Model

Notation	Region	Countries
USA	United States	United States
UK	United Kingdom	United Kingdom
CHI	China	China
IND	India	India

The Individual Life-cycle

Consumer's Optimization Problem

$$V_{a,t,k} = \frac{1}{1 - \frac{1}{\gamma}} \sum_{i=a}^{90} \left(\frac{1}{1 + \delta} \right)^{i-a} P_{a,i,t} \left[c_{a,i,t+i,k}^{1-\frac{1}{\rho}} + \varepsilon \ell_{a,i,t+i,k}^{1-\frac{1}{\rho}} \right]^{\frac{1-\frac{1}{\gamma}}{1-\frac{1}{\rho}}} \quad (1)$$

$$H_{a,t,k} = \frac{1}{1 - \frac{1}{\gamma}} \sum_{i=a-23}^{22} \left(\frac{1}{1 + \delta} \right)^{i-a} K_{a,i,t,k} c_{K_{a,i,t,k}}^{1-\frac{1}{\gamma}} \quad (2)$$

$$A_{a+1,t+1,k} = (A_{a,t,k} + I_{a,t,k}) R_{t+1} + w_{a,t,k} (h_{a,t,k} - \ell_{a,t,k}) - T_{a,t,k} - C_{a,t,k} \quad (3)$$

Production Sector

Each region's GDP, Y_t , equals the sum of an energy-endowment flow X_t and aggregate non-energy output Q_t :

$$Y_t = X_t + Q_t \quad (4)$$

Non-energy output is produced via a Cobb-Douglas technology that uses capital, K_t , and two types of labor, $L_{1,t}$ and $L_{2,t}$, i.e.:

$$Q_t = \phi K_t^\alpha L_{1,t}^{\beta_l} L_{2,t}^{\beta_h}, \quad (5)$$

Profit Maximization Conditions

$$w_{1,t} = \beta_l \phi K_t^\alpha L_{1,t}^{\beta_l - 1} L_{2,t}^{\beta_h} \quad (6)$$

$$w_{2,t} = \beta_h \phi K_t^\alpha L_{1,t}^{\beta_l} L_{2,t}^{\beta_h - 1} \quad (7)$$

$$r_t = (1 - \tau_t^k) \left(\alpha \phi K_t^{\alpha - 1} L_{1,t}^{\beta_l} L_{2,t}^{\beta_h} - \delta_K \right) \quad (8)$$

where τ_t^k references the METR.

Government Sector

- Government collects taxes from households of both skill groups and all ages (consumption tax, income tax, payroll tax), corporate tax revenues net of rebate T_t^k , energy-sector revenue X_t^g , and new borrowing ΔB_t .
- Government expenditures consist of purchases of goods and services (healthcare, education, pension benefits, disability benefits, other spending), C_t^g , transfer payments that are not financed via payroll taxes, and interest on existing debt $r_t B_t$:

$$\sum_{k=1}^2 \sum_{a=21}^{90} T_{a,t,k} N_{a,t,k} + T_t^k + X_t^g + \Delta B_t = C_t^g + \varrho B_t + r_t B_t, \quad (9)$$

Solution

- Guess r_t
- Guess assets S_{it}
- Guess high and low skilled labor L_{it}^H and L_{it}^L
- Call $\sum K_{it}$ from $\sum S_{it} = \sum K_{it} + \sum D_{it}$
- Use r_t equation + guesses r_t + guesses L_{it}^H, L_{it}^L to get K_{it}^N for non US
- Use $\sum K_{it} = \sum K_{it}^N + K_{it}^{US}$ to get K_{it}^{US}
- Use wage equations to get wages in each region
- Use r_t equation for US to get new r_t path
- Use supply side to get new guesses for L_{it}^H, L_{it}^L and S_{it}
